Advantages and disadvantages of water. 6-9-2021

Water is used in every part of the world. If water didn't exist, people could not also exist. Water is used in various places to do various things, at home water is used in cooking, laundry, drinking and bathing.

In the farm water is used in mixing chemicals, cleaning tools and irrigation. Water is also used to cool machines and processing in factories. In recreation water is used in swimming, surfing, boat racing and sport fishing.

In a human being seventy percent of his or her blood is water. When people or animals are thirsty, they drink water so as to quench their thirst.

In some parts of our country there is little water which is used by many people and animals which leads to desertification. There are many ways in which water can be conserved which are: recycling, reusing, harvesting rain water and treating sewage water.

Treating sewage water is purifying waste water. Treating sewage water is done in a sewage plant where water is cleaned and stored in tanks where chemicals are added and purified for drinking.

Even though water is useful, it is also hazardous. When an earthquake occurs, a Tsunami occur which leads to death, loss of property and injuries. When it rains heavily the rain may cause flooding which can lead to diseases like typhoid, bilharzia, cholera and malaria. Rainwater also causes landslides on slopes which causes death and loss of property.

Water is also a home for a variety of some animals. Water is also a natural resource which earns a country foreign currency because of its beautiful sceneries. Water is also used in rearing fish for food or for beauty. We should conserve water sources which include mountains, hills, forest, lakes, swamps and oceans because water is life.
