Water

7-8-2021

Water is the most important component of the environment. All living things, people, both plants and animals depend on water. Water contains dissolved oxygen that is used by animals that live in it. Water is also used for recreational activities and in industries.

Water is good for human consumption. It is treated with chemicals. In Nyahururu water comes from the abadare slopes. It is soft water. Soft water is water that doesn't contain salt or minerals. Hard water is water that contains salt or minerals. Water supply is located in Ndururumo.

A bill is a requirement for someone to pay something you had used. You must pay a bill. What causes sometimes water to get lost is because when the water is treated they switch off the pipe and treat the water bill. In some cases they send a notice when the water shall get lost.

Water conservation is the practice of using water efficiently to reduce unnecessary water usage. Whenever you get water on the road you should report to parent, teacher, police or to the people working in the group of water. In recycling, dirty water is treated and then used again.

Using water sparingly involves using just enough water to do something. This ensures no wastage of water. When industries discharge their waste into the rivers, water becomes polluted. This can lead to death of aquatic life. Industrial waste gases such as sulphur dioxide

produce acid rain.

When sewage is discharged into rivers, plants and animals living in water may die. Sewage can also lead to spread of water borne diseases. Water pollution means making water harmful to plants, human and animals. Without water, all living thing will die. Water is polluted by introducing harmful substance in it. I want to ask everyone who is doing harm to water if she/he doesn't stop, he or she shall be court. It is true that water is life.
